MULTI-ALLERGEN
DISCS

Allergen discs have been established for several decades as reliable diagnostic tools in the detection of specific IgE-antibodies in the serum of allergic patients. The allergen discs are manufactured by covalent binding of allergens to chemically activated paper discs. A prerequisite for the quality of the allergen discs is not only the standardized manufacturing of the solid phase but also the high quality of the extracts used for coupling. The extracts have been standardized and characterized according to state of the art methods. This also includes characterising the extracts on a molecular basis. All allergen discs presented in the catalogue were validated by testing with human positive serum (Spec. IgE), so that they meet the quality requirements of Allergological In-Vitro Diagnostics according to the German Physician's Association. Omega Diagnostics GmbH exceed these requirements by performing additional testing with sera from non-allergic individuals in order to exclude the possibility of any non-specific reactions.

The technical team at Omega Diagnostics GmbH have more than 20 years' experience in the development of products for the diagnosis of allergic diseases. During that time the team has gained substantial knowledge in the production and standardization of allergen extracts. This is being applied in the development of new in vitro diagnostic products and systems.
